

Nutrient Mixing Cheat Sheet

Quick-reference EC / PPM / pH targets by growth stage

Targets by growth stage

Stage	PPM (500 scale)	EC (mS/cm)
Seedling / Clone	100–350	0.2–0.7
Early Veg	350–500	0.7–1.0
Full Veg	500–800	1.0–1.6
Transition (pre-flower)	800–1,000	1.6–2.0
Early Flower	1,000–1,200	2.0–2.4
Peak Flower	1,200–1,600	2.4–3.2
Late Flower / Flush	0–50 (flush only)	0.0–0.1 (flush only)

pH targets

Hydroponic (soilless): 5.5–6.2

Soil: 6.0–7.0

PPM / EC conversion

- 500 scale (Hanna, most common in the US): $EC \times 500 = PPM$
- 700 scale (Truncheon / Bluelab): $EC \times 700 = PPM$
- 640 scale (Eutech): $EC \times 640 = PPM$

Check your meter's documentation to confirm which scale it uses — most American meters default to the 500 scale.

Reading the runoff

PPM/EC readings drift as plants feed — check every 1–2 days and adjust your reservoir or feed strength to stay in range for the current stage. When in doubt, underfeed rather than overfeed: nutrient burn is harder to recover from than a light deficiency.
